

AI Workflow Audit and Tool Setup

Assignment FL-01 — General AI Fluency Track

1. Daily Task Inventory

A breakdown of my recurring daytime and nighttime tasks.

Daytime	Nighttime
• Learn FastAPI • Learn PostgreSQL • Practice FastAPI • Practice PostgreSQL • Basic AI integration • Playing volleyball • Freefire (game)	• Learn web penetration testing • Practice web penetration testing • Learn at least one new tool per week • Scripting

2. Task Classification

Each task grouped by how AI should be involved.

Category	Tasks
Just Me (AI Not Allowed)	• Practicing web penetration testing labs • Exploitation exercises • Playing volleyball • Playing Freefire
Delegate to AI	• Create a FastAPI learning/task plan • Create a PostgreSQL learning/task plan
Collaborate with AI	• FastAPI (explaining complex concepts for understanding) • PostgreSQL (explaining complex concepts for understanding) • Web penetration testing learning
Automate	• Scripting

3. Tool & Account Setup Verification

Screenshots confirming the required tool accounts and course setup.

4. Defining "Done Well" for Target Tasks

For each of my three selected target tasks, I define what success looks like so I can measure my performance rather than just completing the task.

Task 1: Debugging Python Errors

A task is considered done well when:

- The error is resolved within a reasonable time (around 10–15 minutes)
- The code runs smoothly without crashing
- I understand the root cause of the error so I can avoid it in the future

Task 2: Writing LinkedIn Posts

A task is considered done well when:

- The post is clear, engaging, and easy to understand
- There are no grammar or spelling mistakes
- It reflects my personal experience or learning, not just generic content

Task 3: Building API Endpoints

A task is considered done well when:

- The API endpoint works correctly without errors
- It returns the correct and structured JSON response
- Basic security practices are followed (e.g., validation, no obvious vulnerabilities)
